Name: K. Namitha

Regno: 192412080

Assessment tool - CO1

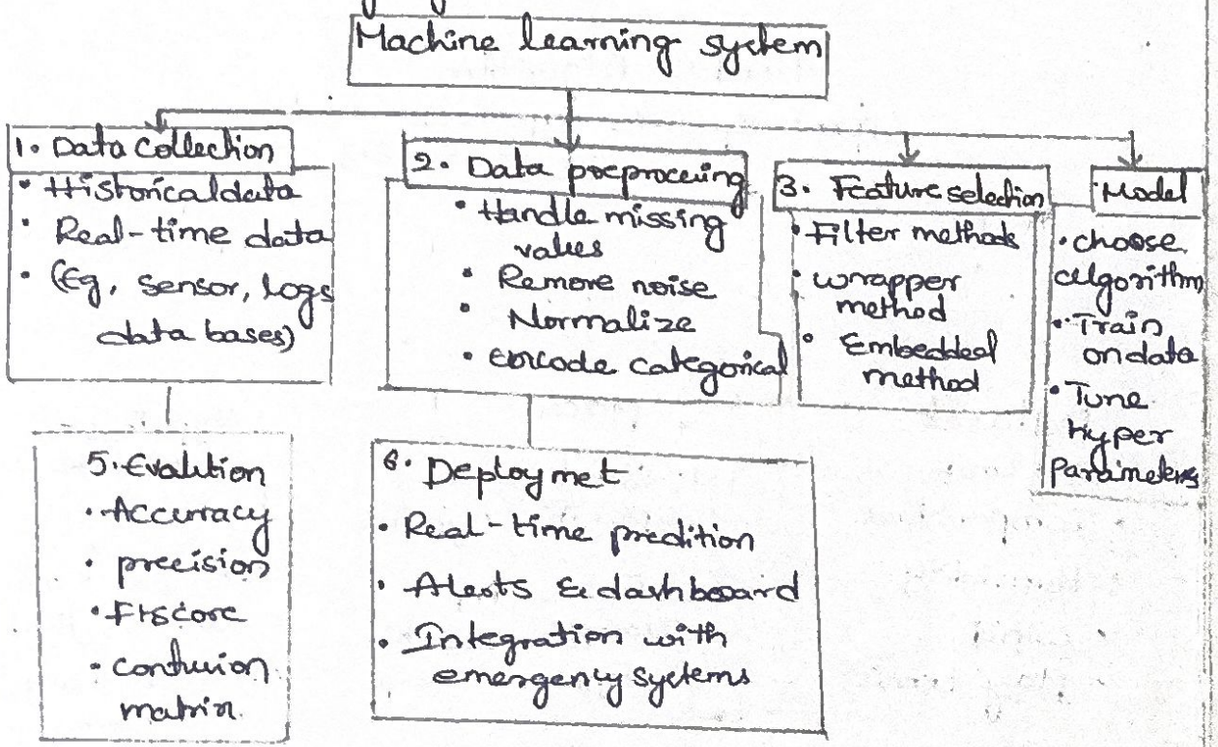

ATQ

Concept map

Date: 14/10/26

Day: Monday

(1) Machine learning system

Supervised Learning — Label

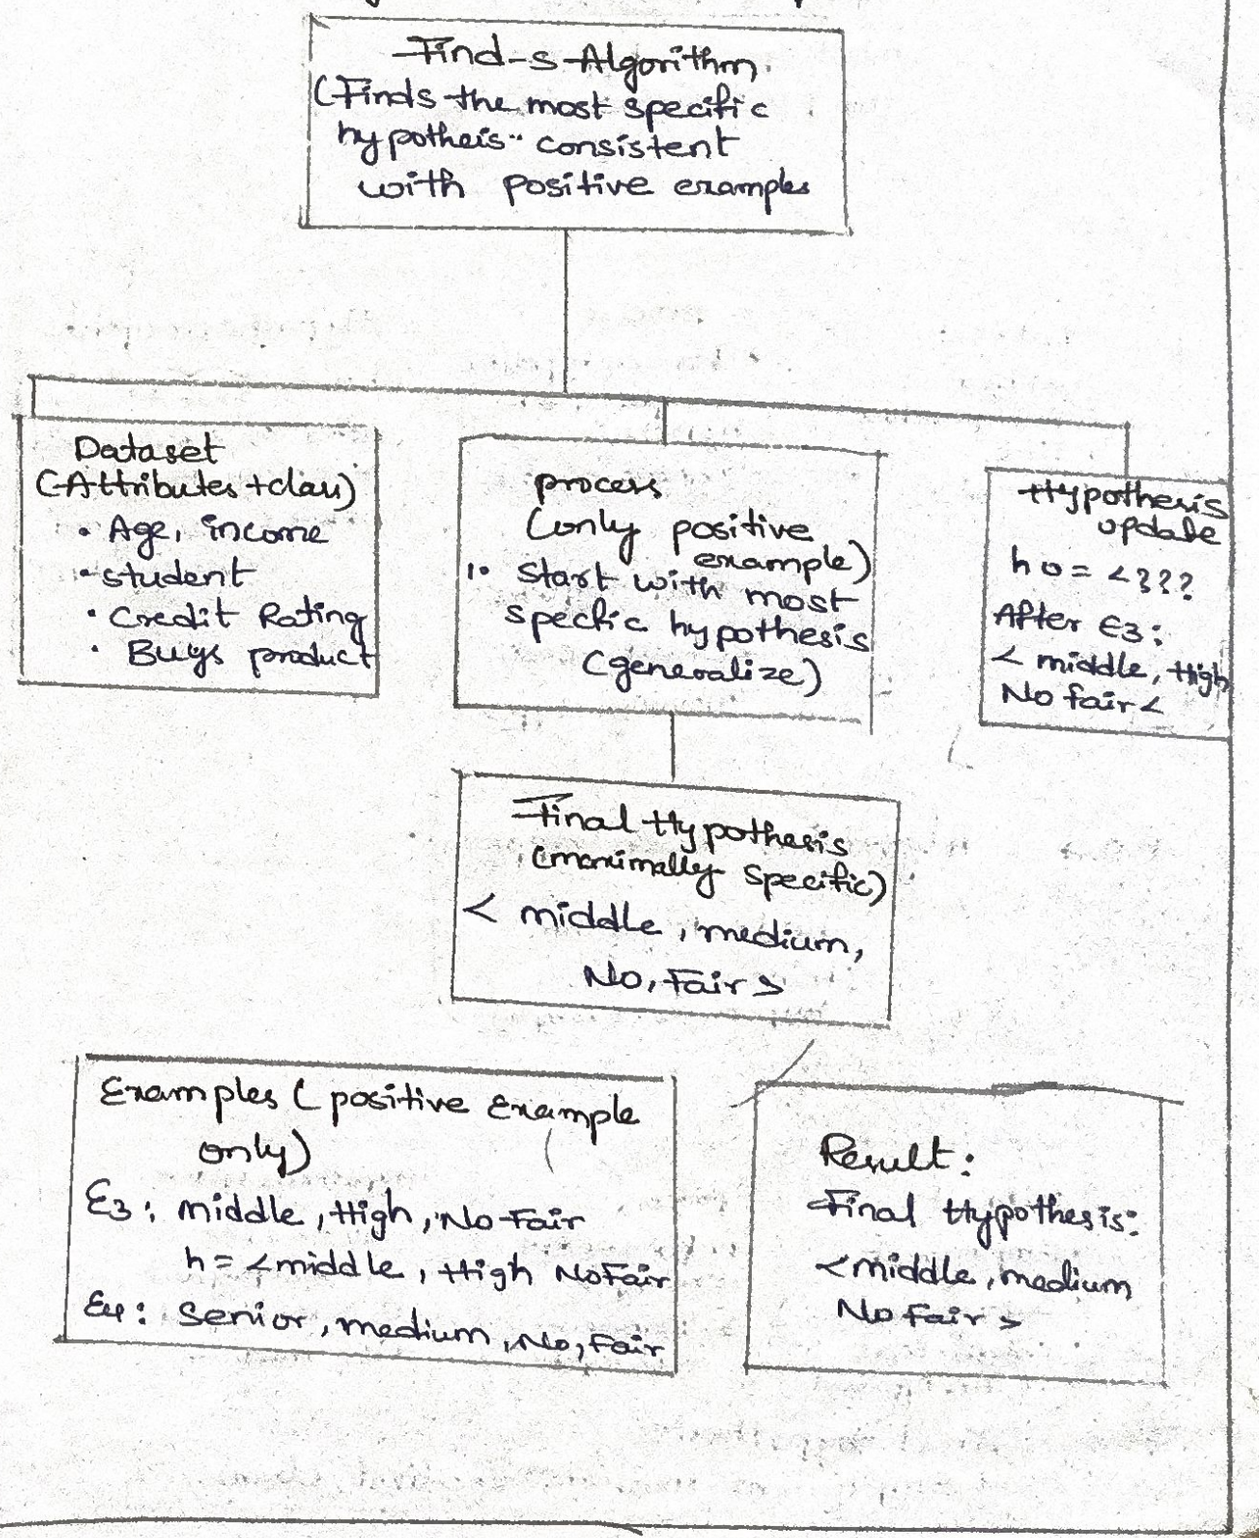

- Temperature, Humidity, wind — Flood / No Flood
- seismic Signals. — Earthquake / No earthquake

used for:

- clasification
- Regression

(eg.., predict flood for earthquake using labeled data)

5. Find-s Algorithm - concept map

6. Finds - Algorithm - workout

Find-s-Algorithm
(most specife hypothesis for positive examples)

Dataset
- weather
- Temperature
- Time
- mood

Process
- For each positive example update hypothesis
- Ignore negative

Hypothesis update
h0 = <? ? ? ?>
After e2 <Rainy, mid evening, Happy>
After e3 <Sunny, mid evening Happy>

Final Hypothesis
<cloudy, cool, morning, Happy>

7. Find s-Algorithm - Loan Approval-

Find-s Algorithm
(most, Specfic hypothesis, example)

Dataset
- Employment
- Salary level
- credit score
- Loan Approved

process
1. For each example
2. Ignore - example

Hypothesis update.
h0 = <? ? ? ?>
e1 = employment
e2 = employed
e3 = medium

Final Hypothesis
< Employment, medium, excellent, clean>.

3. Find-s Algorithm - Tennis Dataset

Find s-Algorithm
(most specific hypothesis for positive Ex)

Dataset
- outlook
- Temperature
- Humidity
- wind
- play tennis

process
1. Start with specific hypothesis
2. For each example update
3. Ignore - example

Hypothesis update
h0 <? ? ? ? >
After e3: <over cast, Hot, High
After e4: Rainy mid Normal

positive examples
e3 : over, Hot, High
e4 : Rainy, mid, High, work
e5 : Rainy, cool, Normal
e7 : overcast, mid, Normal

Final Hypothesis
<overcast, mid Normal, Strong>
